## 1.0 INTRODUCTION

This report present the results of a water quality assessment of the upper Silver Creek watershed that was conducted for the Upper Silver Creek Watershed Stakeholders Group (USCWSG) by United Park City Mines (UPCM). The first report was sent to the stakeholders on July 28, 2000, this report incorporates comments from the group. Resource Management Consultants (RMC) working for UPCM conducted the assessment. Field work was conducted on May 15, 16 and 31, 2000 and June 5, 2000. Samples collected this spring represent high flow conditions, low flow and sediment samples will be collected this fall.

The water quality assessment was conducted in accordance with the Sample and Analysis Plan (SAP) for the USCWSC (RMC, 2000). The work was also conducted in accordance with the National Contingency Plan (NCP), the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), with the oversight and approval of the United States Environmental Protection Agency (EPA) and the Utah Department of Environmental Response and Remediation (UDERR).

Oversight was provided by the EPA Project Manager, Jim Christiansen, Mo Slam and Mike Zucker with UDERR. In addition Paul Lammers with Park City Municipal Corporation (PCMC) was present during a portion of the field activities. Gary Colgan, the Quality Assurance official was present to observe some of the sample collection procedures.

In November of 1999 the USCWSG was formed to examine environmental concerns in the watershed. As part of that examination the group has initiated an assessment of water quality in the upper Silver Creek watershed. This report presents water quality and limited quantity data for review and discussion by the USCWSG.

The objectives, as determined by the USCWSG, of the water quality assessment are stated in the SAP (RMC, May 2, 2000). In summary the objectives of the sampling program were to collect samples to identify potential source areas that may adversely

impact Silver Creek water quality, coordinate data collection activities, provide data for Total Maximum Daily Load (TMDL) analyses, establish procedures for data analyses, define Quality Assurance/Quality Control measures, and establish Health and Safety procedures.

## **2.0 REPORT ORGANIZATION**

The format of this report has been selected to present a narrative on the water sample collection activities, briefly discuss the analytical results, note general observations and document the Quality Assurance/Quality Control (QAQC) review of the data. The QAQC data review is presented in Appendix A of this report. The laboratory analytical reports are in Appendix B. Figure 1 of this report graphically portrays locations of the sample stations.

## **3.0 WATER SAMPLE COLLECTION**

Twenty-six (26) surface water samples were collected during the field activities, stream flow measurements were conducted at twelve (12) locations. In the May 1, 2000 SAP there were thirty-one (31) sample locations selected to characterize water quality in the study area. The study area is shown on Figure 2.0 of the SAP and can be described as Silver Creek tributary drainages beginning south of Park City, Utah downstream to just below the Richardson Flat tailings impoundment. In addition the Thaynes Canyon drainage was also included in the study area it is a tributary of East Canyon Creek. Of the thirty-one (31) locations identified in the SAP eighteen (18) were sampled and nine (9) opportunity samples were collected (see Table 1). Opportunity samples are identified in the SAP as those samples that are selected, in the field, by the sampling team to quantify snowmelt or stormwater runoff impacts.

The sampling was conducted over an extended time period due to the relatively low spring runoff flows. At most of the upper watershed locations (south of Park City) flows were only present during the afternoon when the ambient air temperatures were high enough to generate snowmelt. The Thaynes Canyon samples could not be collected in May due to snowdrifts that prevented access into the canyon.

At each location field parameters, pH, conductivity, and temperature were measured, where possible flow data was collected using either a Parshall flume, flow meter, or calibrated bucket and stop watch. Water quality samples were collected and preserved, sealed with tamper tape and stored for that day in an ice-chest. At the end of the day the samples were either delivered directly to the analytical laboratory or stored in a secured refrigerator.

UDERR representatives collected duplicate samples at various locations, laboratory analytical data are pending and will be incorporated into this report when available.

#### **4.0 WATER QUALITY AND QUANTITY RESULTS**

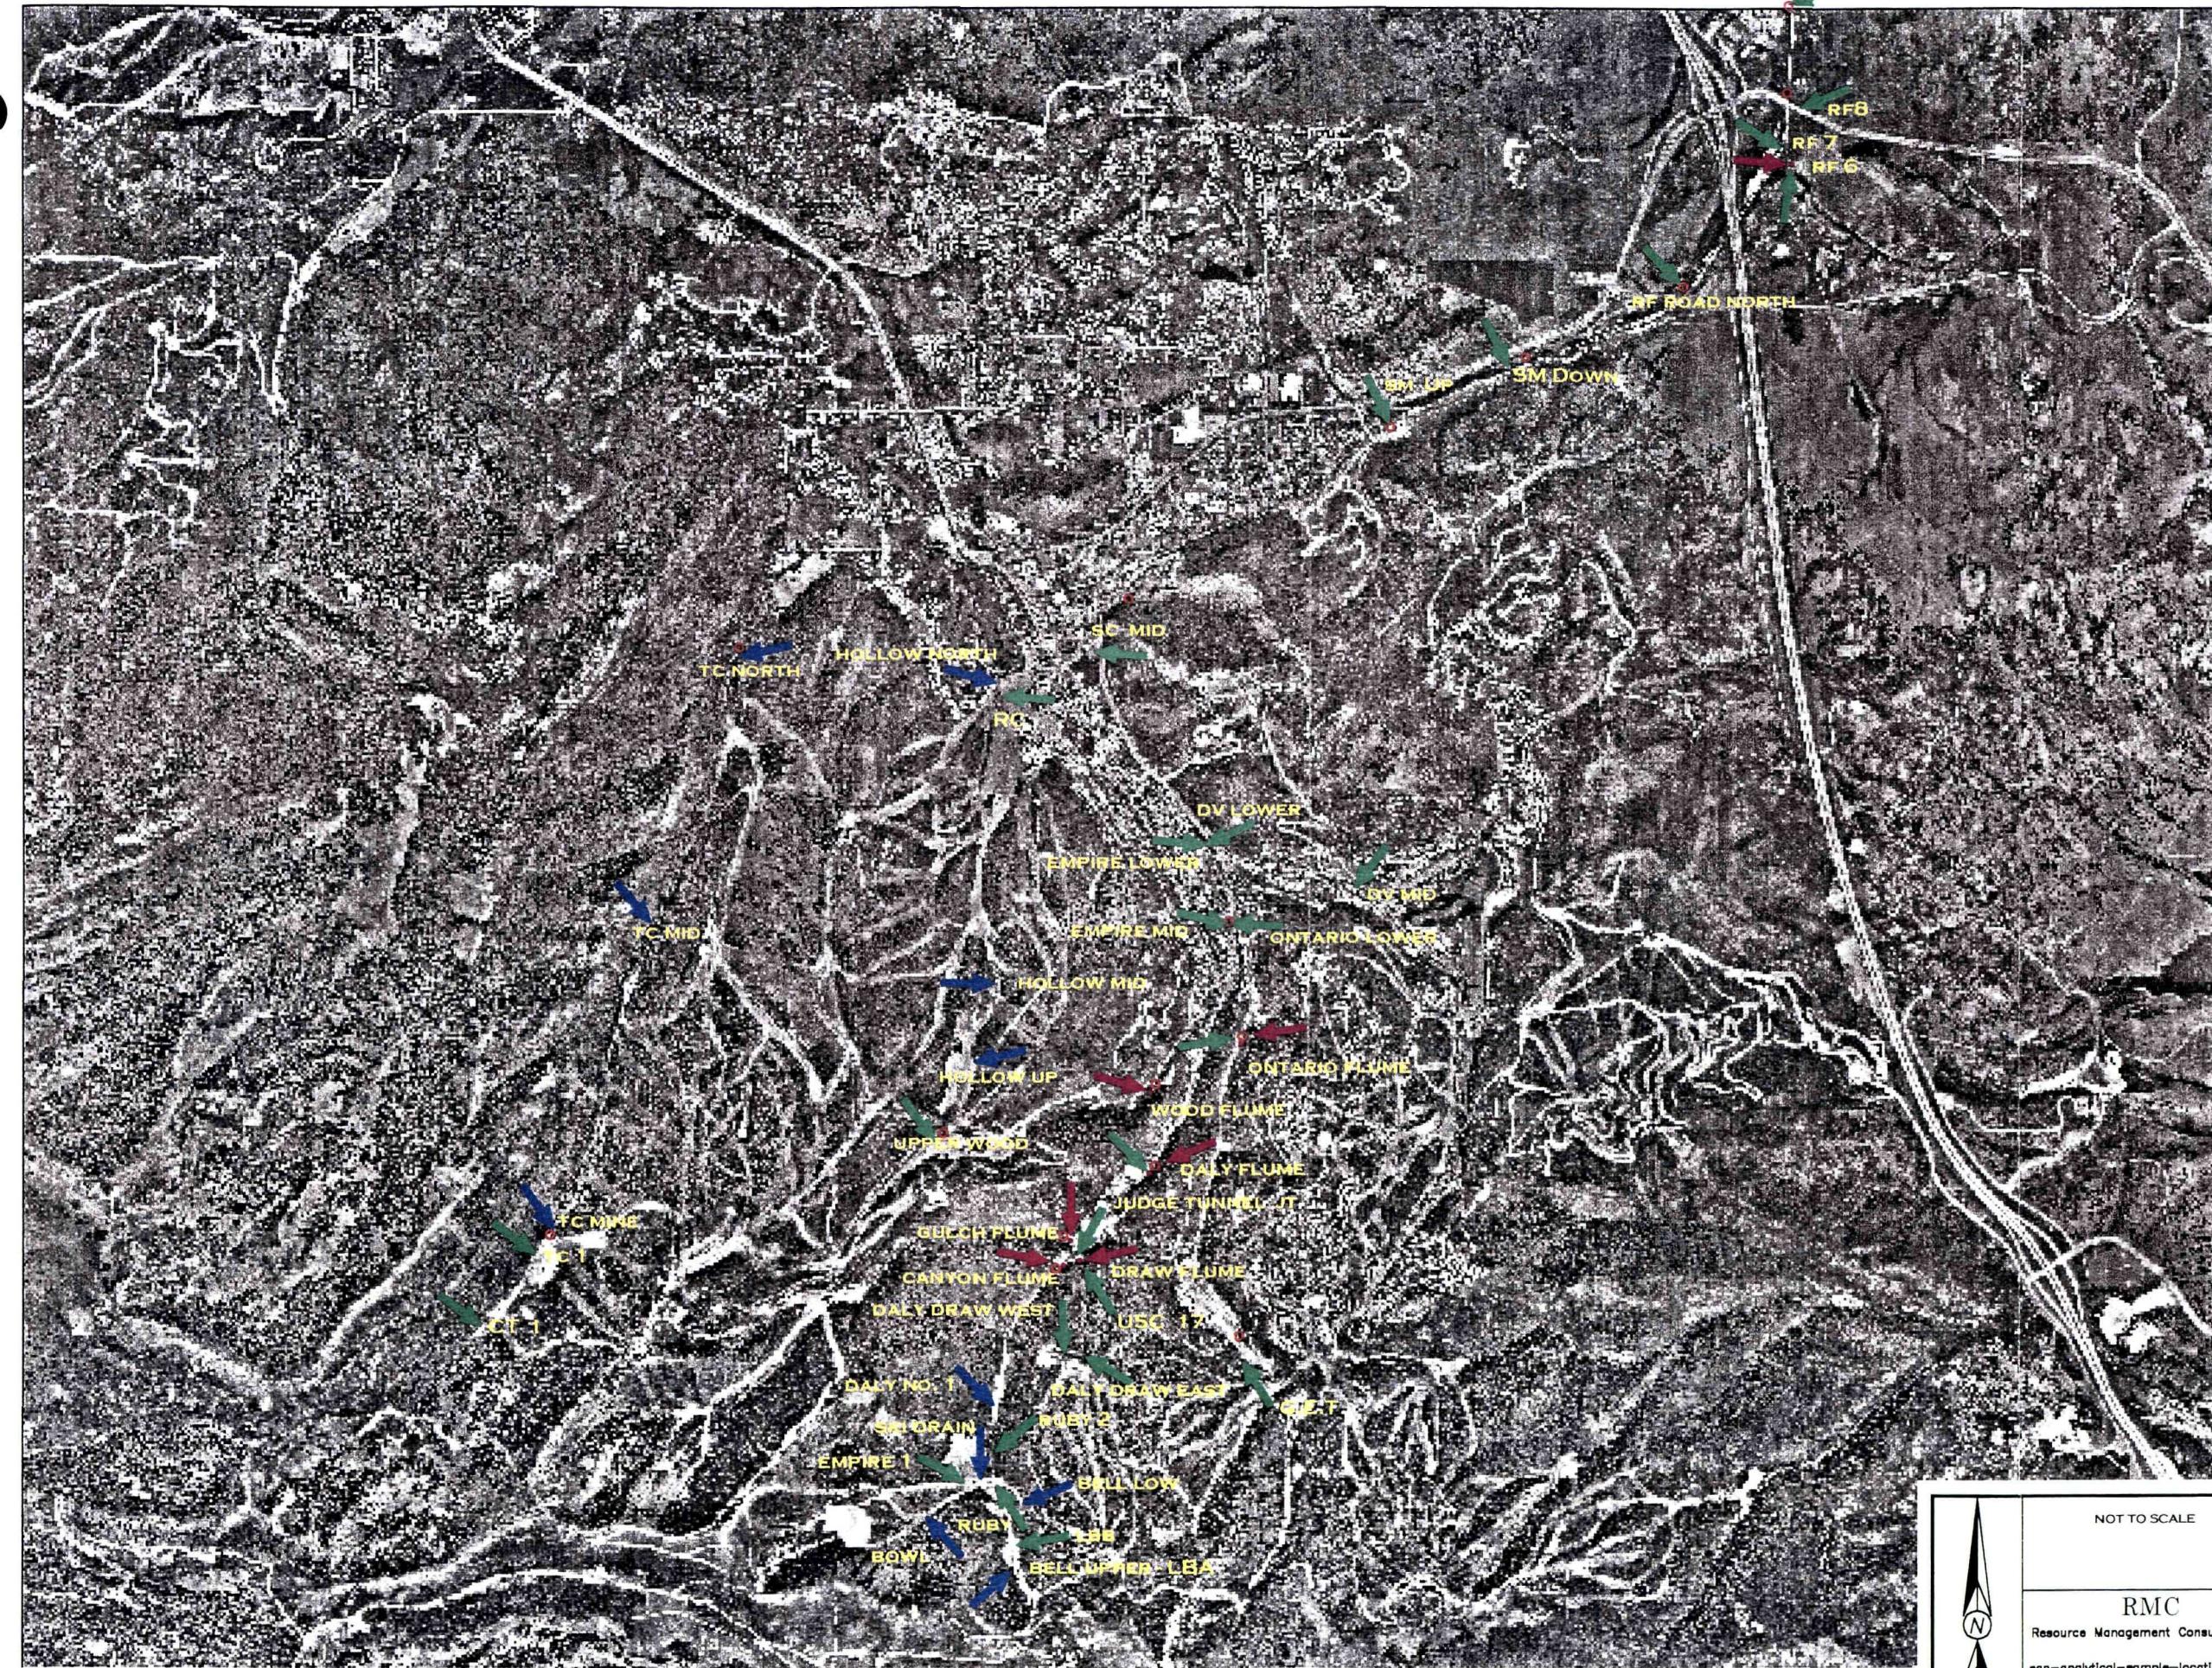

Water quality samples were analyzed for inorganic parameters and at some sites for nutrient and sediment parameters. Table 2 presents a summary of the data collected for this sampling event. Appendix A contains laboratory analytical data reports. Not all tributary drainages were sampled due to the low or non-existent spring runoff flows in the ephemeral and intermittent drainages. As expected the flow data show that stream flows increased from the upper to the lower sites.

#### **5.0 WATER QUALITY DATA VALIDATION**

Appendix A contains the water quality data validation report. The data validation process evaluates if the specific requirements for the intended use have been fulfilled and ensures that the results conform to the user's needs. Overall, the data appear to be adequate for the intended use and of good quality. However, the laboratory did notice a pattern of "possible low-level spot lead contamination" in one batch of laboratory samples. To ensure that the lead results were accurate, the entire batch was redigested and reanalyzed. Lead results were corrected for two samples, USC-JT and USC-12 as a result of the repeat analyses.

## DATA REVIEW REPORT

### Upper Silver Creek Watershed Stakeholders Group Sampling Round 1

#### INTRODUCTION

This report presents the results of the validation of analytical data for surface water samples collected May 15, 16 and 31, 2000 and June 5, 2000 along Upper Silver Creek, near Park City, Utah. American Environmental Consultants (AEC) Laboratory in Salt Lake City and Frontier Geosciences Inc. (mercury only) performed the analyses. Table 1 summarizes the samples collected, sample dates, parameters analyzed, and laboratory sample batch numbers and related laboratory QC numbers. The laboratory analytical reports, including the laboratory quality control data, are provided in Appendix A.

The data validation process evaluates whether the specific requirements for an intended use have been fulfilled and ensures that the results conform to the user's needs. This report summarizes the review of sampling and analysis to assess conformance with QC requirements for this project. This data evaluation is presented in terms of the PARCC criteria and is based on the *U.S. EPA Functional Guidelines for Inorganic Data Review* (U.S. EPA, 1994), on the quality control limits established by the analytical laboratory or as specified by the specific analytical method, and on the *Upper Silver Creek Watershed Stakeholders Group Sampling and Analysis Plan (SAP)* (Environmental Resource Management Consultants dba RMC, May 2000). The analytical results were evaluated against data quality objectives (DQOs), which are quantitative and qualitative statements that specify data quality and are expressed in terms of precision, accuracy, representativeness, comparability, and completeness (PARCC). Tables 1 and 3 of the SAP describe the DQOs and QA/QC goals for this project. Table 4 of the SAP presents the data validation and verification requirements for this project.

Twenty-seven surface water samples (26 samples plus one duplicate) were analyzed for the parameters noted in Table 1. The analytical data were validated and qualified based on the results of the following data evaluation parameters or quality control (QC) samples:

- Appropriate methods run
- Extraction and analytical holding times
- Matrix spike (MS) and matrix spike duplicate (MSD) samples
- Method blank samples
- Laboratory control samples
- Laboratory duplicate samples
- Field duplicate samples
- Reporting limits
- Cation/anion balances.

The next section of this report summarizes the data validation results following the list of data validation and verification requirements in Table 4 of the SAP. The third and final section of this report summarizes the data validation results in terms of PARCC criteria, including completeness calculations expressing the percent complete of valid data compared to the total number of samples collected. This section also makes recommendations for suggested alterations to the sampling and analysis program to improve data collection and analytical protocols in the event additional sampling is conducted..

## **DATA VALIDATION RESULTS**

### **Sampling Locations and Frequencies**

Although it was not possible to collect samples at all sample stations listed in Table 5 of the SAP because of low spring runoff conditions this year, samples and quality control (QC) samples were collected at selected stations and as opportunity samples where possible. At the other stations listed on Table 5 of the SAP (USC-16, 18 through 24, and 26 through 31), samples were not collected because water was not present.

## Sample Collection and Handling

Samples were collected and handled in accordance with the procedures described in the SAP. Sample collection and handling procedures were verified in the field by the project QA Officer and members of the Stakeholders Group. Sample collection and handling procedures were documented in field notes and chain-of-custody/laboratory request forms.

## Analytical Methods

Although standard EPA-approved analytical methods were used in all cases, there are a few minor discrepancies between the analytical methods used by AEC Laboratory and those specified in the project SAP. Specifically, EPA Method 350.1 instead of 353.2 was used for ammonia ( $\text{NH}_3$ ) and EPA Method 365.1 instead of 353.2 was used for phosphate ( $\text{PO}_4$ ). The methods specified in the SAP were incorrect method references which should be changed. Methods 6010 (ICP) and 6020 (ICPMS) compared to Method 200.8 specified in the final version of Table 2 of the SAP were used to analyze metals. This discrepancy occurred because the laboratory was not aware of a late change in the SAP. However, except for some minor differences in QA procedures and limits, Methods 6010 and 6020 are the same as Method 200.7 and 200.8, respectively. For example, the method-specified control limits for LCS samples are 85-115% for Methods 200.7 and 200.8 compared to 80 to 120% for Methods 6010 and 6020. The spike recovery limits are also somewhat different: 70-130% for Methods 200.7 and 200.7 and 75-125% for Methods 6010 and 6020.

The laboratory performed internal laboratory calibration checks according to the method-specified protocols. Case narratives were compiled in the analyst's logbook, in digestion logs, and as raw data.

All analytical methods specified in the SAP were run except TDS, TSS, and laboratory pH on three samples (Ruby 1, Ruby 2, and Empire 1). Because of a delay submitting these samples to the laboratory, these parameters were not run because holding times were already exceeded.

### Holding Times

Holding time reflects the length of time after sample collection that a sample or extract remains representative of environmental conditions. Holding times were compared to standard method-specific holding times accepted by the EPA as listed in Table 2 of the SAP. Data for samples that were extracted and analyzed within holding time criteria are considered representative. For samples that were extracted or analyzed outside of holding criteria, the sample data are qualitatively evaluated to determine the potential effect of the holding time violation on sample representativeness.

All holding times were met except for samples where pH and hardness were analyzed (List 1). For pH, the SAP (Table 2) specifies that laboratory pH measurements be performed within one day, however, the laboratory measured pH after seven days. The method specifies that samples should be “analyzed immediately” for pH which is not practical for samples transported to a laboratory. Since pH was also measured in the field at the time of sampling, these measurements should be used. Hardness was analyzed after approximately 25 days compared to 14 days specified in the SAP. However, because hardness is calculated from calcium and magnesium data (which both have holding times of 28 days), the holding times specified by the method was not exceeded. The holding time for hardness should be changed in the SAP to 180 days.

### Reporting Limits

The reporting limits specified in the SAP (Table 2) were met in most cases by the laboratories. However, reporting limits for three analytes were sometimes higher than those specified in the SAP. QA results could not support lower reporting limits for these parameters. These elevated reporting limits were generally ten times higher than those specified in the SAP. The following are a list of analytes, the elevated reporting limits, and the number of non-detect values reported with these elevated limits:

- aluminum, 0.04 or 0.05 compared to 0.005 ppm (30 out of 42 analyses)
- chromium, 0.010 compared to 0.005 ppm (18 out of 22 analyses)
- potassium, 2.0 compared to 1.0 ppm (3 out of 11 analyses).

### **Field Duplicates**

One set of blind field duplicates was collected during Round 1: USC-32 was collected as a duplicate of USC-3. However, for the number of samples collected (26), three duplicate sets should have been submitted to the laboratory. No duplicate samples were submitted to Frontier Geosciences for mercury analysis. Table 2 summarizes the relative percent difference (RPD) calculations for the one set of duplicates. For the USC-3/USC-32 duplicate set, the calculated RPDs are excellent, all less than 20 percent compared to the QA/QC goal of 35 percent (if > 5 times LRL) or +/- LRL (if < 5 times LRL).

In addition to the field duplicates discussed above, the Utah DEQ collected split samples at seven sampling locations (USC-1, USC-5, USC-12, USC-13, USC-15, USC-JT, and TC-1. Table 3 provides a comparison of the primary analytical results (validated in this report) with the state splits. As shown in Table 3, the split sample results show excellent correlation with the primary analytical results. With two minor exceptions, calculated RPDs were within established QA/QC goals for field duplicates. Where the reporting limits for the compared samples were different, an average of the two LRLs was used to assess compliance with QA/QC goals for duplicate samples. The exceptions include: (1) total lead results for sample USC-5, 0.026 mg/l compared to the state split of 0.0145 mg/l; and total lead results for sample USC-13, 0.052 compared to the state split of 0.0362 mg/l. In one case the state result was lower than the primary result and in the other case the state result was lower than the primary result.

### **Laboratory QC Samples**

AEC Laboratory analyzed matrix spike/matrix spike duplicate, method (prep) blank, and lab control samples for each sample batch to evaluate data quality. For four out of five batches, no matrix spike duplicates were run, but laboratory duplicate samples were prepared and analyzed. This is consistent with the quality control requirements outlined in the SAP (Section 3.5) except that the laboratory analyzed a set of laboratory duplicates rather than a matrix spike duplicate for three out of four batches. The laboratory indicated that this was their routine procedure until recently (when they started running MSDs instead of duplicates) and because of the confusion over project requirements, MSDs were

not run on the first four sample batches. The sample laboratory sample batches with associated laboratory QC numbers consisted of: L000743/WG000406 (22 samples); L000828/WG000435 (2 samples); L000829/WG000436 (1 sample); L000864/WG000451 (2 samples); and L001164/WG000635 (2 samples). MSDs were only run on batch L001164/WG000635.

Frontier Geosciences analyzed matrix spike and matrix spike duplicate, method blank, and lab control samples for the single batch of seven samples for mercury analysis to evaluate data quality.

**Matrix Spike Samples.** A matrix spike sample was analyzed for each laboratory sample batch by AEC Laboratory. All of the spike recoveries for the five matrix spike samples were within method-specified control limits. However, for most analytes, the quality control requirement (Section 3.5 of SAP) of running MS/MSDs at a rate of ten percent of the sample load for each sample type was not met. As shown in Table 4, MS samples were run at a frequency of more than ten percent of the samples for cadmium (total and dissolved); iron (total and dissolved), lead (total and dissolved), manganese (total and dissolved), and zinc (total and dissolved). MS samples were analyzed at a frequency between 8 and 10 percent for most of the remaining parameters except aluminum (total and dissolved) at a frequency of 4.8 percent. No MS samples were run for carbonate (titration), bicarbonate (titration), and sulfate (colorimetric) because the methods are not amenable to running MS samples. Overall, MS samples were run at an average frequency of 10.5 percent. Considering that most analytical programs only require an MS/MSD frequency of five percent, the reduced MS load is not a concern, although this requirement should be clarified and discussed with the laboratory before the next sampling event. RPDs for MS/MSDs for batch L001164/WG000635 were well within method-specified control limits.

One set of matrix spike and matrix spike duplicate samples was analyzed for the batch of seven samples analyzed by Frontier Geosciences, a frequency of 14 percent. All of the spike recoveries and MS/MSD RPDs were within method-specified control limits.

**Method (Prep) Blanks.** A method or prep blank sample was analyzed for each laboratory sample batch. No analytes were detected in any of the method blanks indicating that no

laboratory contamination was present. However, the AEC Laboratory did notice a pattern of “possible low-level spot lead contamination” in laboratory batch L000743. To ensure that the lead results were accurate, the entire batch was redigested and reanalyzed. Lead results were corrected for two samples, USC-JT (L000743-002) and USC-12 (L000743-008), as a result of the repeat analyses.

**Laboratory Control Samples.** Laboratory control samples were analyzed for each laboratory sample batch by each laboratory. All of the recoveries for the laboratory control samples were within method-specified control limits.

**Laboratory Duplicates.** AEC Laboratory randomly prepared a set of split or duplicate samples from one of the submitted samples which were analyzed as a check on the reproducibility of the laboratory results. Split samples were prepared and analyzed for three out of four laboratory batches. The calculated RPDs for these samples were all less than 20 percent, with most results within 10 percent, indicating excellent reproducibility.

#### **Cation/Anion Balance**

AEC Laboratory calculated cation/anion balances for all samples where List 1 parameters were analyzed. The cation/anion balances for these 11 samples ranged from -7.6 to 1.8 percent, indicating good major ion balances. This result indicates that the major ion data can be used with a high degree of confidence even though MS samples were not run for all major ions.

#### **Data Reduction**

For the purposes of developing a database and preparing summary tables for reports, all laboratory data will be transferred from the laboratory to United Park City Mines in both paper and electronic form. UPCM will ensure that the data is forwarded to the stakeholders group.

### **DATA VALIDATION SUMMARY**

This section summarizes the data validation results in terms of PARCC (Precision, Accuracy, Representativeness, Comparability, and Completeness) criteria, including completeness calculations expressing the percent complete of valid data compared to the

total number of samples collected. These results are then compared to the project QA/QC goals (Table 3 of SAP). This section also makes recommendations for alterations to the sampling and analysis program to improve data collection and analytical protocols for the second sampling round.

### **PARCC Criteria Summary**

**Precision.** Based on the results of the field duplicates, laboratory duplicates, and matrix spike results, the data are precise. Although MS, MSD, and blind duplicate samples were not always run at the frequency specified in the SAP, the available data along with other measurements of precision indicate that the data can be used with a high degree of confidence.

**Accuracy.** Based on the percent recoveries of the MS/MSD and laboratory control samples, the data are accurate. Although MS, MSD, and blind duplicate samples were not always run at the frequency specified in the SAP, the available data along with other measurements of accuracy indicate that the data can be used with a high degree of confidence.

**Representativeness.** Based on the results of the holding time review, method blank data, and blind duplicate sample data evaluation, the data for this project can be considered representative of water quality conditions along Upper Silver Creek.

**Comparability.** Standard methods of sample collection and standard units of measure were used during this project. The analyses performed by the laboratory were in accordance with current SW-846 and other U.S. EPA methodology. Results of field and laboratory duplicate analyses were excellent.

**Completeness.** Based on the results of the data validation, all data are considered valid without qualification. Sampling and analytical completeness is 99 percent, indicating that the completeness goal of 90 percent was met for the project. Only three samples (Ruby 1, Ruby 2, and Empire 1) were not analyzed for all specified parameters (TSS, TDS, and lab pH).

## Recommendations

To improve future data collection and analytical protocols, the following recommendations should be implemented:

- Verify the methods to be used with the laboratory, and make adjustments to the laboratory methods or SAP as necessary. For comparability reasons, the same laboratory methods should probably be used for any future sampling events.
- Verify reporting limits with laboratory and request that laboratory meet the reporting limits listed in the SAP if critical (i.e., if reporting limits are at or above water quality criteria). Adjust SAP if necessary.
- Review SAP requirements for matrix spike and matrix spike duplicates and discuss with laboratory. Adjust SAP if necessary.
- Make sure field team collects and submits field duplicate samples at the SAP-specified frequency (10 percent) by better organizing bottle kits and deciding in advance where duplicates are to be collected.

**AMERICAN ENVIRONMENTAL CONSULTANTS LABORATORY**

3422 South 700 West Salt Lake City, Utah 84119-4191

(801) 261-1426 • FAX (801) 264-9838

July 31, 2000

Mr. Kerry Gee  
**UNITED PARK CITY MINES**  
Box 1450  
Park City, Utah 84060

Dear Mr. Gee:

Please find attached amended analytical results for water samples collected May 15, 16, and 31, 2000, in association with the Silver Creek Watershed Project. Samples were amended to reflect the correct date of analysis for TDS for our lab batch L000743. Initially the date was reported incorrectly due to a transcription error. Also some results have been amended with a lower reporting limit to comply with the detection limit stated in the sampling and analysis plan for this project. There was some confusion as to which Park City Mines project these samples were associated with and the respective reporting limit.

The samples were received by the laboratory on May 15, 16 and June 1, 2000.

Sincerely,

Vince Keller  
Laboratory Coordinator

---------	----------------	-------------	-----------	-------	-------	---------	---------------	-----------	--------

pH is a field parameter therefore holding time cannot be met  
by the laboratory.  
Digestion Methods for totals --- 3010 and 6020.

Mr. Kerry Gee  
**UNITED PARK CITY MINES**  
Box 1450  
Park City, Utah 84060

Dear Mr. Gee:

Please find attached the analytical results for two water samples collected on May 16, 2000, and received by the laboratory on July 21, 2000.

Sincerely,

Duane Coble  
Laboratory/Environmental  
Technician

Attach.
